Single Muon Re-check

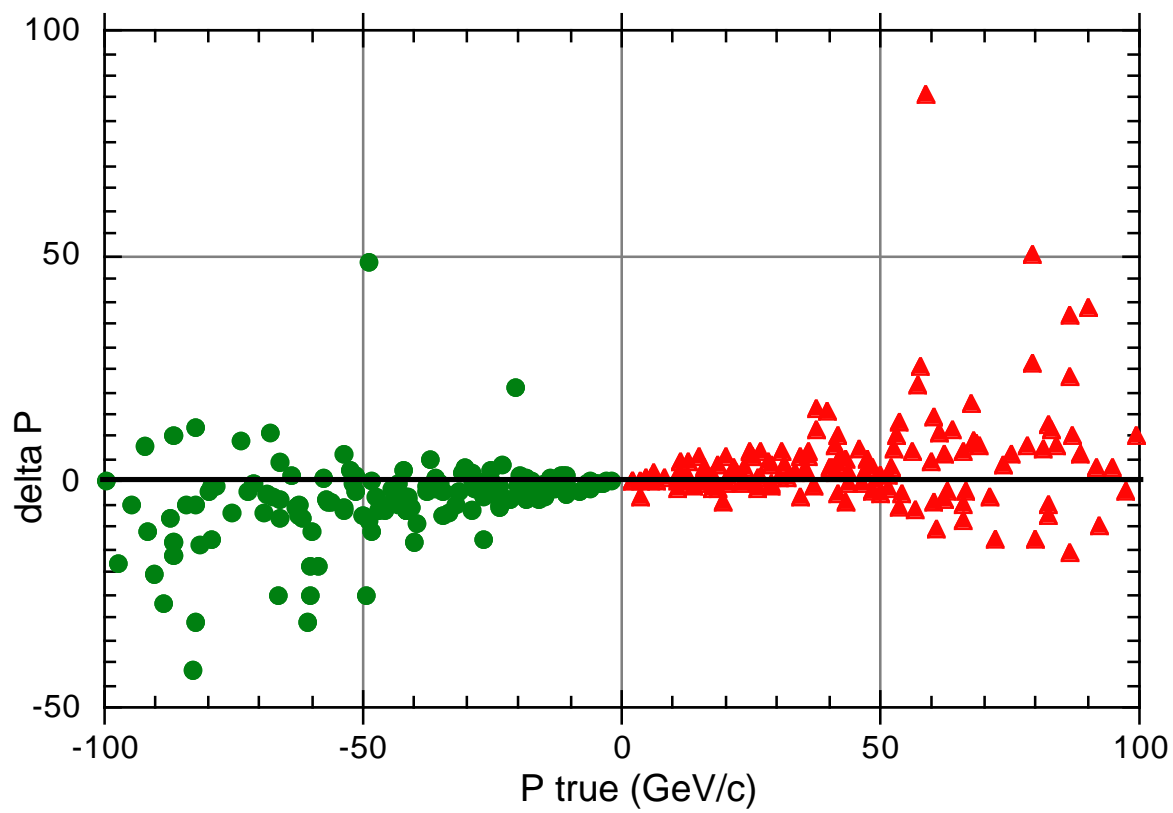

I thought I might have made an error in calculating the true momentum, so I ran these files again, but the result is the same.

Single Muon Resolution

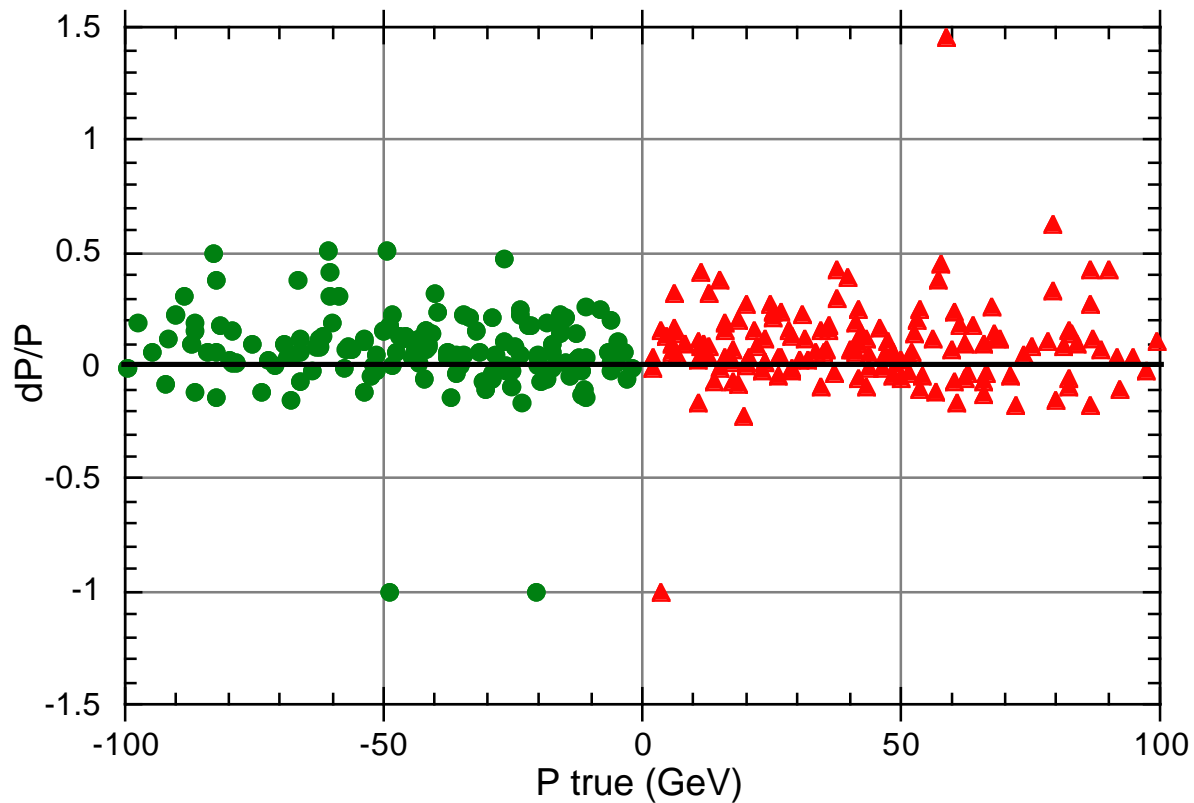

The resolution appears to have two components - a gaussian centroid, and a high end tail.

ΔP vs. P

$\Delta P/P$ vs. P

Here we see the definitely positive offset of the resolution; unfortunately this same effect is not seen in the reconstructed muons of the CC events.
